ABSTRACT

A 5- and 10-year follow-up study of vocational-technical school graduates was conducted to obtain and analyze graduate data that could assist planning toward improvement of the state vocational-technical schools. Data concerning school and employment were collected by questionnaire from 974 graduates: 364 from the class of 1958 and 610 from the class of 1963. The format and detail of the data analysis were based on the first 400 responses. Of the 1963 graduates who responded to the questionnaires, 78 percent were in related employment, only 1.3 percent were unemployed, the average salary was $3.53, 40 had received advance degrees, and 129 were in apprenticeship programs. Data is presented in tabular form. A summary report is available as VT 008 792. (CH)

Acknowledgments

The University Research Institute of Connecticut, Inc. (URIC) is an independent consortium of the research interests and capabilities of ten Connecticut universities and colleges. This research project could not have been achieved without their individual cooperation, and the acknowledgment of URIC's "associated institutions" is most appropriate, viz:

FAIRFIELD UNIVERSITY

UNIVERSITY OF BRIDGEPORT

WESLEYAN UNIVERSITY

TRINITY COLLEGE

UNIVERSITY OF HARTFORD

RENSSELAER POLYTECHNIC INSTITUTE OF CONNECTICUT

YALE UNIVERSITY

ST. JOSEPH COLLEGE

CONNECTICUT COLLEGE

NEW HAVEN COLLEGE

The guidance and assistance of Dr. Herbert Righthand, Chief, Bureau of Vocational Services, and Messrs. Richard C. Wilson and Charles J. Bertagna, research consultants, Division of Education in the Bureau of Vocational Services, of the Connecticut State Department of Education, are gratefully acknowledged. The cooperation of the guidance counselors and others of the fourteen State Regional Vocational-Technical Schools is also acknowledged.

Summary

This five and ten year state vocational-technical school graduate follow-up study was contracted by the Connecticut State Department of Education with University Research Institute of Connecticut, Inc. The purpose of the study was to obtain and analyze graduate data that could assist planning toward improvement of the state vocational-technical schools. The graduate data sought included: employment history, current employment status and hourly salary, 'mobility' (i.e., whether graduate had left and returned to Connecticut), job relatedness to school trade taken, reasons for unrelated employment, job satisfaction, retrospective evaluation of vocational-technical school course work, retrospective evaluation of vocational-technical school education, suggestions for improvement of school programs, further education, apprenticeship experience, and organizational affiliations.

The study encompassed 2,175 graduates in the Classes of 1958 and 1963 who took twenty-seven different trade courses at fourteen (14) Connecticut vocational-technical schools. It was carried out from December 1968 to March 1969.

The pertinent graduates were solicited by a confidential questionnaire, developed by URIC, Inc. and approved by the State Department of Education, from alumni records furnished by the schools. (A copy of the questionnaire is appended to this report.) Up to three (3) solicitations were made by first class mail of each graduate at his or her last known address, or later addresses obtained from available directories.

Based upon the first 400 questionnaire responses, the format and detail of the data analyses were agreed upon between representatives

of the State Department of Education and URIC, and are presented herein accordingly.

It should be noted that the overall reported response (44.3%) was quite good. Over forty (40) additional responses were received too late for inclusion in the analysis. Some questionnaires were returned incomplete, especially in employment history, hence measures of unemployment and per job term of employment are not considered accurate. All usable information obtained was included in the analysis, including the count of deceased graduates as respondents. Organizational affiliation information proved so varied as to be meaningless, hence is not included in this report.

A Summary Report, prepared primarily for school and general distribution, includes all the basic tables presented herein, but excludes several of the data distribution by trades and the depth (correlation) analyses. These tables include the letter R in their respective titles. This Research Report is prepared primarily for research personnel, appropriate Department of Education personnel and Directors of the Regional Vocational-Technical Schools.

Considerable effort has been made to assure accuracy of the data herein. However, errors are human, and readers should be aware that interpretation of any of the reported data could be misleading if without benefit of knowledge of the techniques employed in the coding and analyses.

STUDY DESCRIPTION AND COMMENTS

Solicitations

The first first-class mail solicitation of pertinent graduates was completed on December 10, 1968. A total of 2,146 questionnaires were sent, with some twenty-nine additional graduates reported deceased or without known addresses by the vocational-technical schools. This solicitation produced 460 replies (21%). An additional 324 questionnaires were resent from the first solicitation prior to the second questionnaire solicitation of 1,368 graduates which was completed on January 24, 1969. This solicitation produced 242 replies (14%). Approximately fifty second solicitation questionnaires were resent. The third questionnaire solicitation of 1,233 graduates was completed on February 18, 1969, and produced 263 replies (21%) by March 3, 1969 when data analysis started. Somewhat over forty additional replies (1.5%) received after March 3 were not used in the analysis.

Solicitations were recorded on a flow control log and master lists of the graduates, and further controlled by a postage due account (to accommodate Business Reply Mail) with the Wallingford Post Office. The master lists, one for each Class, serially numbered each graduate with six digits. All graduates in the Class of 1958 received number identity in the last four digits below 1000; all graduates in the Class of 1963 received similar identity above 1000. The first digit was used to designate the solicitation number.

All mailed questionnaires had the six digit coding and prior completion of the graduate's name, address, school, class and trade per available records. Each questionnaire solicitation included a personally signed request letter and a prepaid business reply envelope.

A total of 565 questionnaire solicitations were returned as

undeliverable by the post office. These solicitations were resent to alternate addresses obtained from available directories and from revised graduate lists furnished upon request from the vocational-technical schools. Somewhat over 150 additional graduates from the two classes were identified with unknown addresses, and ten additional graduates were identified as deceased. The net overall response, assuming mailed questionnaires not postally returned were received by graduates, was 50.9%.

All questionnaire returns and replies were stamped with date of postal delivery. All valid replies were preliminarily coded in groups, arranged by numerical identity sequence, and filed by school and class.

Coding

Preliminary coding was done in the blank right-hand column provided on the printed confidential questionnaire. Four code entries on employment, opposite Question No.1, indicated: a) number of employers, b) number of unemployment periods, 3) total number of months unemployed, and d) employment status - with E designating "employed", U designating "unemployed", M.S. designating "in military service", S designating "full-time student", and H.W. designating "housewife". Replies by or for deceased or disabled graduates were considered as replies but non-responses.

Current employer code, opposite Question 2(A), was checked if included in employment history, or coded by a + sign if not. Salaries reported were reduced to basic hourly wage, based upon a 40-hour week unless otherwise noted, or a 2,000 hour man-year, prorated where monthly salary figures were reported. Job relatedness and satisfaction responses were coded 1, 2 or 3, opposite Questions 2(E) and 2(G) respectively, for "closely related", "somewhat related" and

"unrelated", and "highly satisfied", "satisfied" and "dissatisfied" replies respectively.

Evaluation of course importance were coded 1, 2, 3 and 4 for "not important", "some value", "important", and "very important" replies respectively, opposite Question 3(A). Further education reported was coded by a + sign opposite Question 3(C), and apprenticeship program experience replies were coded by credit given (as stated), and program completion and enrollment by "yes" or "no", opposite Question 3(D).

Coding marks of N/R and N/A were used to designate "non-response" or "not applicable", respectively, throughout the questionnaire.

The second stage of coding included attitudinal evaluation of school program evaluation comments, and school improvement suggestion replies. A + sign was used for positive attitude, a - sign for negative attitude, and a zero for neutral responses.

Further coding included (green) identity marking in left column opposite employers (Question No. 1) of random sampling for analysis of employment periods. All questionnaire replies with information considered unusual were coded by circling (red) of serial control numbers with arrows or underlining of pertinent information. Also, all questionnaires received after March 3 and not used in the data analyses were coded "Too Late".

Data Analyses

The coded questionnaire information was accumulated on five sets of data work sheets, by Class, school and trade as appropriate, which served as the basis for Tables presented herein. Analysis of tabular data was based upon use of all applicable information received. It should be noted that data was incomplete or not valid in many cases.

Accumulation of pertinent data indicated complete presentation of data and analyses by trades could be misinterpreted readily in view of the small sample. Hence, data is presented only for major trades and compatible groups of trades. Ground rules for data consideration were as follows:

Employment History: Employers were counted only once although graduates redefined employment due to promotions, etc. Employers were counted multiple if graduate left and returned to the same employer as noted by other employment or status entry. Student (full time) status was not considered employment, military service status was considered employed. Housewives were considered neither employed nor unemployed, and not available for employment.

In initial coding (approximately 100 questionnaires) all unaccounted periods were considered unemployment periods. This rationale was not considered valid in view of other potential unstated status of the graduate, hence dropped, and only unemployment periods so designated by the respondents were accumulated as valid. In view of the negligible total amount of unemployment recorded (35 periods averaging 4.1 months, or 143 months, for 364 respondents of the Class of 1958, over a ten-year period, for example) this change in data treatment was not considered detrimental to the essence of the reported data. However, unaccounted periods and student and housewife status prevented direct analysis of average employment periods per job. A random sampling approach to employment period measurement proved invalid. Hence the average employment period was computed as a "best estimate" (presented in Tables 3A and 3B) and cannot be considered reliable.

Current Employment: Information furnished by housewives and

students was considered "not applicable". Salary information of graduates in military service was not included in data analyses. Relatedness of employment to trade course taken was verified by comparison of employment duties and trade taken, with very few changes made. Dual replies of job relatedness and satisfaction were considered the more positive response, except as created by dual employment where the major job responses were used. Again, the numbers involved in these instances were few and of little significance in the overall analyses.

Reasons given for unrelated employment were tabulated on a basis of "number of mentions" by separate analyses and are presented by schools in Tables 3A/S and 3B/S, catagorized in relation to "old vocation", "new vocation", and "other". Dual or multiple respondent reasons are included separately in the tabulation. Reasons given are grouped in the Tables by simple statements which summarize the essence of the information given. For example, one graduate in unrelated employment gave a dollar sign ($) as his (or her) pertinent reason, which was summarized in the new vocation category under the statement "more money".

Vocational-Technical Schools: All N/R coding of school subject importance was disregarded in both count and average in the data analyses. Hence, data reported relates only to respondents who provided positive information. Attitudinal evaluation of vocational-technical school education meaning to the graduate were predominately positive, 89% and 94% for the Classes of 1958 and 1963, respectively. Positive responses were generically equivalent to an endorsement of motherhood in a variety of verbiage, hence not considered appropriate for further analysis. Negative responses were too few for analyses, but it should be noted that the majority of negative responses related to retrospective dissatisfaction with instructors.

Attitudinal evaluation of school program improvement suggestions

also was predominately positive, 98% for the Class of 1958 and 94% for the Class of 1963. This information was analyzed separately and is presented in Tables 4A/S and 4B/S by trades. The Tables include negative attitudinal response, but again it should be noted that the majority of negative responses related to retrospective dissatisfaction with instructors. Also, it should be noted that comments (data) were grouped for simplicity of presentation in the same manner as previously noted for reasons (data) for unrelated employment.

Tabulation of further education was done directly from the completed questionnaires to the pertinent sets of data work sheets without coding. Differentation between further education on a vocational-technical level and on a higher educational level was most difficult as some institutions of higher education engage in some non-credit vocational-technical educational activities, and, since 1963 the State Technical Institutes have been upgraded to State Technical Colleges. The pertinent analyses is based on best judgment, and the resultant presentation (Tables 3A/R S-2 and 3B/R S-2) is considered reasonably valid.

Apprenticeship Program Experience: The graduate information obtained on apprenticeships proved too varied for data analysis. Accordingly, the detailed raw data is presented in summary by trades in Tables 3A/S-1 and 3B/S-1. (Consideration of the range of apprenticeship credit given is outside the scope of this study. However, the analyses of reasons for unrelated employment and retrospective school improvement suggestions contained in this report indicate general relatedness to apprenticeship programs. One basic factor in the range of apprenticeship credit given could be interim experience between graduation and start of an apprenticeship program, but this was not

recognized in development of the follow-up study questionnaire. Further research of apprenticeship programs by graduate participants identified by this study is suggested.) It should be noted that a few apprenticeship programs in other than the vocational-technical trade taken were reported.

Organizational Affiliations: Analysis of pertinent information in the first 400 graduate questionnaire responses proved meaningless, hence is not reported herein.

Comments

This report provides comparative data and analyses related to the value of a vocational-technical education to respondents five and ten years after graduation in terms of employment stability, salary attained and further educational achievement. Accordingly, it can serve as a basis to promote and enhance vocational-technical school planning. It is also a measure of school and course comparison. However, it must be recognized that the data presented herein represents slightly less than half of the pertinent graduates, in toto, and even a lesser number for most of the specific information obtained.

The subjective information on reasons for unrelated employment and vocational-technical school program improvements could be most helpful in planning, although steps have probably already been taken to correct many of the reasons for unrelated employment and to initiate many of the school program improvements suggested by the respondents.

While retrospective research is desirable, necessary and important, the true value of this study effort could lie in its use to expose current and future students in the vocational-technical schools to the retrospective evaluation by alumni. Specifically, it is

suggested that consideration be given to presentation of pertinent summary data from this report and representative examples of respondents' comments to the assembled student bodies by a lecture accompanied by use of visual aids.
